Remote Installation.

“Remote installation was no problem at all. RMS provided us with very thorough and detailed installation manual and all the tools needed for proper installation of RetroTek-D on our vehicle (Ford Ranger).

The installation took a few hours without any major issues. After the installation we went on the test run with RMS technician remotely connected to the system and they confirmed that the installation was done correctly and according to installation manual.

We conducted a test survey with 3 loops of the same road section to make sure that the system is calibrated correctly (Repeatability & Reproducibility test). The RMS technician was remotely connected to the system during the whole session.

After completed Repeatability & Reproducibility test, RMS analysed the data and they confirmed that the RetroTek-D is installed and operating correctly. They also sent us a report of the test.

We received Training Certificates for successfully completed training in the operation of RetroTek-D.

In my opinion the whole remote installation and training saved us at iCeste and RMS Ltd a lot of valuable time and unnecessary costs.”

Mr. Matija Kajba.
